Minogain 2.5mg Therapy in the treatment of Androgenetic alopecia : A case report

Dr. Sandeep Babbar MD
Director - Revvyve Group of Clinics

Case Report

5 patients all in their Mid 20's, 4 male patients, and 1 female patient with a history of Androgenetic alopecia. Patients were counseled for starting PRP and minogain 2.5 mg for 6 months. Along with that, they started on biotin, Vit-D3, and peptides like procapil, and aminexil. PRP was also given 15 days apart for 6 months. A history of hypertension and cardiac profile was taken. BP was monitored at every visit. All patients had the above satisfactory results.

Minogain 2.5mg Therapy
